

PROCESS REDESIGN & OPERATIONAL EXCELLENCE

From an Ideal Process to a Process That Works in Reality

A Process Redesign Case Study — Portfolio Edition

Kunal | Operations Manager, Brand Studio (GCC), Atlas Copco

This is a condensed, public-facing summary. Certain process details have been generalized to protect organizational and client confidentiality — reach out for the full walkthrough.

THE CHALLENGE

A Growing Studio Was Outgrowing Its Process

Brand Studio's client-servicing process — from first enquiry through delivery, invoicing and closure — had served the team well. But as the studio scaled across more service lines and functions, the original process (designed mainly around the ideal path) began to show its limits.

1

Ideal-path documentation

Covered the happy path well, but not the exceptions

2

Unclear ownership

Roles were implied by function, not assigned per step

3

Limited exception handling

Few defined fallback paths for real-world situations

4

Inconsistent execution

Teams interpreted the same steps differently

The net effect: delays, rework, and support that depended heavily on individual experience rather than a consistent, shared process.

A Structured, Standards-Based Redesign

Rather than a quick fix, the redesign followed a recognized process-excellence lifecycle — studying how work actually happened before redesigning it, and building in the structure to keep it accurate over time.

Grounded in globally recognized Business Process Management practice — As-Is/To-Be modeling, root-cause analysis, ownership design and continuous-improvement governance — applied practically to this studio's context.

One Process, Reimagined as Four Focused Stages

The single end-to-end process was decomposed into four stage-specific processes — each with a defined owner, explicit decision points and a documented path for when things don't go as planned.

Every activity across all four stages now defines:

Documentation itself was redesigned in two layers — a Quick Overview for “how does this work?” and a Detailed Process for “what exactly do I do here?”

Standardized, Rolled Out, and Built to Evolve

A redesigned process only matters if people can use it and it keeps up with reality. Three things made that possible.

1

SOPs & Documentation

Every stage backed by a practical, two-level SOP — used both as a daily reference and to onboard new joiners without relying solely on individual knowledge.

2

Team Walkthroughs

Rolled out session by session with each function — explaining the logic, clarifying ownership, and discussing how exceptions should be handled before go-live.

3

Continuous Governance

A recurring audit-and-improve loop: track recurring issues, understand root cause, and update the process and SOP — so it keeps evolving with the business.

From Ad-Hoc Execution to a Reliable Operating Model

Process clarity

Clear ownership & accountability

Cross-functional coordination

Visible handoffs

Defined exception handling

Less dependence on individual knowledge

Consistent execution

Faster onboarding

A process that evolves with feedback

“A process is not successful because it looks good on paper. It is successful when people can use it to make the right decision when reality doesn’t follow the plan.”

THANK YOU

Let's Talk About the Full Story

This case study has been shared at a high level to protect client and organizational confidentiality. The full version — including detailed workflows, SOP examples, exception scenarios and measurable outcomes — is available on request.
